

ZOIKOSUITE

Commercial Operations, Subscription & Governed Platform

Operating Standard

Executive doctrine

ZoikoSuite must preserve one governed chain of truth from commercial entitlement and organizational context through connected-system facts, obligations, controls, workflow decisions, evidence, approvals, AI-assisted recommendations, execution and audit — without silently replacing the systems of record, qualified professional judgment, legal authority, or a tenant’s own accountability. No action may become commercially billable, operationally authoritative, compliance-relevant or externally represented as complete because of stale configuration, unsupported jurisdiction, unverified source data, model confidence alone, an unapproved automation, failed integration, missing evidence, or cross-tenant/cross-product contamination.

Field	Value
Document ID	ZSU-COM-OPS-001
Version	1.0 — Commercial Launch & Governed Operations Standard
Date	August 7, 2026
Status	Build-ready commercial/product/engineering baseline; final price book, plan limits, market availability, legal claims, integration certification, AI execution scopes, security controls, numeric service objectives and formal go-live approval remain mandatory.
Owner	ZoikoSuite Product / Commercial
Prepared for	Engineering, Product, Finance, Commercial, Customer Success, Security, Privacy, Legal/Compliance, Data Governance, AI/ML, QA, Support, Partnerships, Solutions Architecture
Language	American English
Classification	Confidential — Internal Use
Legal operator	Zoiko Tech Inc — contracting, merchant, tax, privacy and invoice details must match verified Finance, Legal, processor, bank and market records before live charging.
Product model	Commercially independent standalone SaaS + optional integrated Zoiko One component; approved Zoiko products and external systems connect through governed interfaces rather than implicit commercial bundling.
Product category	Governed Business Operations Intelligence Platform
Primary executive buyer paths	CFO / Finance; General Counsel / Legal & Compliance; CIO / Technology & Governance

Field	Value
Product stage	Platform and public architecture are established; commercial catalog, market-specific release claims, integrated control definitions and production acceptance evidence must remain registry-governed.

33	Critical Analysis of Current Product & Commercial Drift
34	Authoritative Source Basis & Precedence
35	Final CTO / Commercial Doctrine

REFINED FINAL — COMMERCIAL, PRODUCT & ENGINEERING BASELINE

This standard is intentionally stricter than a pricing document or feature catalogue. It governs ZoikoSuite commercial truth, tenant and legal-entity scope, capability entitlements, connected systems of record, compliance/control intelligence, jurisdictional rules, evidence provenance, AI and automation boundaries, human approvals, integrations, reporting, ZoikoSuite subscription billing, Zoiko One bundling, security, privacy, retention, testing and production acceptance. Where the approved commercial or product record is incomplete, the system must fail closed rather than invent price, legal coverage, compliance status, market availability or autonomous authority.

1. Executive Commercial & Product Decisions

Area	Canonical decision
Product taxonomy	ZoikoSuite is a governed business operations intelligence platform. It unifies control, evidence, policy, workflow and decision intelligence across business operations without claiming to be the universal system of record for every accounting, HR, payroll, billing, tax, legal or ERP domain.
Commercial model	Standalone SaaS is independently purchasable. ZoikoSuite may also be delivered through Zoiko One or enterprise agreements. Commercial independence must remain explicit even where shared platform services and native Zoiko integrations are reused.
Plan taxonomy	Catalog-controlled. This standard does not invent public plan names, prices, limits, add-ons, usage rates or trial terms that are not present in an approved current pricing registry.
Buyer model	Primary executive paths are CFO, General Counsel and CIO. Product packaging may share core platform capabilities while buyer-specific workflows, evidence and outcomes remain distinct.
Core commercial object	The customer buys entitlement to a governed platform capability set, not a promise that every legal, regulatory, tax or operational obligation is automatically satisfied.
System-of-record posture	Connected ERP, HCM, payroll, billing, accounting, identity, document, ticketing and legal systems remain authoritative for the facts they own unless an explicit migration/ownership contract transfers authority to ZoikoSuite.
Compliance posture	ZoikoSuite may identify obligations, map controls, collect evidence, orchestrate review and report status. It must not market configuration, automation or AI output as guaranteed legal/regulatory compliance.

Area	Canonical decision
AI posture	AI supports classification, synthesis, prioritization, drafting, recommendations and narrowly approved automations. AI confidence is never, by itself, authority to change a legal position, file a return, approve financial treatment, terminate employment, change payroll, pay money, or certify compliance.
Evidence posture	Material decisions and control states must be reconstructable from versioned source facts, policies, rule versions, actors, approvals and events. Current state cannot overwrite historical truth.
Market posture	Global by controlled configuration and release registry, not by universal claim. Jurisdiction, language, residency, provider, legal-content, tax, employment and integration availability are independently gated.
Pricing posture	No feature, integration event, AI token, document, user, entity, workflow or record becomes billable merely because it is measurable. Billability requires approved catalog definition, disclosure, entitlement and customer authorization.
Zoiko One posture	Zoiko One is an optional distribution/integration path, not a prerequisite. The same entitlement period must never be invoiced twice through direct ZoikoSuite and Zoiko One channels.
Testing posture	Production, staging, sandbox, demo and QA are explicitly classified. Synthetic data and non-production provider credentials are mandatory for default test paths.
Release truth	Public claims, runtime capability and commercial entitlement consume the same release/market/capability registries. Marketing copy never outranks authoritative runtime or contractual state.

IMPORTANT COMMERCIAL CONSISTENCY CORRECTION

ZoikoSuite's approved positioning and persona architecture are strong, but the available controlled record does not establish a final paid price book or public plan taxonomy here. Engineering, Design, Finance, Sales, Zoiko One configuration, processor objects, contracts, renewal logic and Support must therefore consume one versioned pricing and entitlement registry. This document deliberately refuses to invent a price, plan name or trial promise.

2. Canonical ZoikoSuite Architecture

Layer	Authoritative role
Commercial account layer	Customer contract, plan/catalog version, billing source, subscription, add-ons, usage authorization, Zoiko One source, renewal and payment state.
Organization & workspace layer	Tenant identity, legal entities, business units, workspaces, members, roles, regions, policies and data classifications.
Capability & orchestration layer	Obligations, controls, workflows, cases, tasks, attestations, evidence requests, approvals, exceptions, remediation and automation policies.
Intelligence layer	Regional intelligence, rule/policy mapping, source-backed reasoning, classification, recommendations, summarization, prioritization and scenario analysis.
Evidence & assurance layer	Evidence objects, provenance, control tests, review decisions, immutable audit events, replay manifests, retention/legal hold and assurance exports.

Layer	Authoritative role
Integration layer	ERP, HCM, payroll, billing, finance, IAM, ticketing, document repositories, communication platforms, tax/regulatory sources and approved Zoiko products.
Experience layer	Executive command centers, CFO/GC/CIO views, operations workspaces, reviewer queues, dashboards, reporting, APIs and administrative consoles.

One commercial catalog version controls public pricing, checkout, entitlements, Zoiko One bundle mappings, processor products/prices, contracts/order forms, invoices, in-app upgrade paths, support tooling, analytics and renewal logic. One capability/release registry separately controls whether a capability exists, is entitled, is production-enabled, is market-eligible and is safe to execute.

A feature can therefore be technically implemented but commercially unavailable; commercially entitled but market-restricted; market-eligible but disabled by security/incident state; or visible as read-only while execution remains gated. These are separate dimensions and must never be compressed into one feature flag.

3. Five-Plane Trust Doctrine — Non-Negotiable Separation

Plane	Scope
PLANE 1 — ZOIKO COMMERCIAL ACCOUNT	What Zoiko Tech Inc charges for access to ZoikoSuite: catalog, contract, subscription, platform invoice, tax, payment, renewal, credit/refund and product entitlement.
PLANE 2 — TENANT BUSINESS OPERATIONS	The tenant's own operating facts, entities, processes, controls, obligations, cases, tasks, evidence, approvals and remediation.
PLANE 3 — CONNECTED SYSTEM AUTHORITY	Authoritative facts that remain owned by connected systems: accounting/ERP entries, payroll results, HR records, billing transactions, IAM identities, legal matter records, source documents and provider evidence.
PLANE 4 — GOVERNANCE & EVIDENCE	Policies, obligation maps, control definitions, evidence provenance, control tests, attestations, exceptions, approvals, audit events, review and assurance status.
PLANE 5 — AI & AUTOMATION	Model output, rule evaluation, recommendations, prioritization, drafted actions and approved agent/tool execution. This plane may propose or execute only within explicit authority and must never overwrite the other planes without governed interfaces.

- ZoikoSuite subscription payment state may affect access to ZoikoSuite, but it may never mutate the tenant's underlying accounting, payroll, billing, HR or legal facts.
- A connected-system event may update a governed fact or trigger a workflow, but it does not silently become ZoikoSuite commercial usage unless the approved catalog defines that meter and customer authorization exists.
- An AI recommendation may create a reviewable proposal; it does not become a legal conclusion, control pass, filing, payment, employee action or accounting posting without the required deterministic validations and authority.
- Compliance status is derived from scoped obligations, control design/operation, evidence, exceptions and review. A green dashboard cannot exist merely because integrations are healthy.
- Cross-product analytics may aggregate approved metadata after tenant, purpose and data-class checks; raw tenant records remain product- and role-scoped.

4. P0 Launch Blockers — No-Go Until Closed

1. Lock the current price catalog, public plan taxonomy, billing intervals, currencies, included limits, add-ons, approved usage metrics, overages, cancellation, renewal and Enterprise routing. Missing commercial mappings block live charging.
2. Normalize ZoikoSuite positioning, plan labels, entitlements and CTA language across homepage, pricing, signup, app, Zoiko One, CRM, contracts, email, help center and support tooling.

3. Decide and configure trial/evaluation posture. No “free trial,” cardless evaluation or auto-conversion path may exist unless its program terms are explicit and approved.
4. Implement billing_classification and billing_source for every workspace, including Zoiko One, pilots, internal, demo, partner, QA and legacy environments.
5. Implement double-charge prevention between standalone ZoikoSuite and Zoiko One, including period overlap checks, transfer records and split-billing exception approvals.
6. Complete merchant, tax, processor and invoice identity for ZoikoSuite’s own subscription billing before live self-service charging.
7. Create capability_registry, market_release_registry and claim_registry as separate production controls. Marketing availability must be generated from approved release truth, not manual page copy.
8. Define the system-of-record matrix for every integrated domain and field family. No integration may silently convert a replica or cache into authoritative truth.
9. Complete obligation/control/evidence schemas, effective-date versioning and status semantics so “compliant,” “controlled,” “verified,” “complete” and “approved” have deterministic meanings.
10. Define AI risk classes, human-review triggers and autonomous-action allowlist. High-impact actions require deterministic validation and maker-checker where applicable.
11. Implement immutable/auditable evidence and policy histories. Material past decisions must replay against the source/policy versions active at that time.
12. Implement server-side authorization and segregation of duties for policy edits, control overrides, evidence acceptance, role changes, exports, integration credentials, commercial discounts and subscription payment details.
13. Implement idempotency, transactional outbox/equivalent and dedupe across imports, webhooks, workflow triggers, AI tool execution, evidence ingestion, notifications and subscription billing.
14. Complete data-residency, privacy, retention/legal-hold and provider-governance configuration for each launch market and data class.
15. Provision isolated production/staging/test with synthetic data, non-production integrations, test webhooks and isolated communications.
16. Complete Section 27 Production Acceptance Checklist with Product, Commercial, Engineering, Security, Legal/Compliance, Privacy, Data Governance, AI/ML and QA sign-off.

5. A. Commercial Account, Organization, Workspace & Legal Entity Model

A1. What is the top-level tenant object?

Decision: ORGANIZATION is the commercial/product tenant. Workspaces and legal entities sit beneath it.

Commercial / product rationale: Enterprise customers may have multiple business units, jurisdictions and operational workspaces without needing duplicate commercial identities.

Engineering rule: Persist organization_id, commercial_account_id, workspace_id and legal_entity_id separately. Do not infer legal entity, region or subscription payer from the signed-in user.

A2. Can one organization operate multiple legal entities and business units?

Decision: Yes, when entitled and market-enabled.

Commercial / product rationale: Governance, evidence and reporting often differ by legal entity, employing entity, reporting entity or operating unit.

Engineering rule: Every obligation, control, evidence item, workflow and report row carries the appropriate organization/workspace/entity scope. Cross-entity aggregation is explicit and traceable.

A3. Can users belong to multiple organizations or workspaces?

Decision: Yes, with scoped membership.

Commercial / product rationale: Advisers, shared-service teams and group executives may need controlled cross-organization access.

Engineering rule: Resolve actor + organization + workspace + entity + data class + permission on every request; deny by default when scope is ambiguous.

A4. What is the commercial account?

Decision: The verified customer record that buys ZoikoSuite.

Commercial / product rationale: The buyer, payer and contracting entity may differ from operational users and entities being governed.

Engineering rule: commercial_account stores legal customer name, billing/tax facts, contract/order references, processor customer refs, billing_source, renewal and payment state. Operational data stays separate.

A5. Can workspaces be created without being billable?

Decision: Yes.

Commercial / product rationale: Pilots, internal controls, implementation workspaces and sandboxes may be legitimate non-billable estates.

Engineering rule: Workspace charge authorization requires billing_classification + entitlement + catalog/contract + billable event. Environment name or workspace age is never enough.

A6. What happens when a member is removed?

Decision: Access ends according to security policy; historical attribution remains.

Commercial / product rationale: Governance evidence must retain who approved, changed or reviewed past items.

Engineering rule: Deactivate membership and revoke sessions/tokens; do not delete actor IDs from audit history, evidence, approvals or historical exports.

6. B. Plans, Packaging, Contracts, Trials, Entitlements & Upgrades

B1. What are the canonical public plans?

Decision: Whatever the current APPROVED pricing registry defines; this standard does not invent names.

Commercial / product rationale: The available product record confirms tiered pricing architecture but not a final price book in this operating standard.

Engineering rule: Use stable internal plan_id and catalog_version_id independent of display label. Unknown or unpublished mappings fail closed.

B2. What can a plan entitle?

Decision: Approved capability packs, user/entity/workspace limits, integrations, evidence volume, AI/automation allowances, support/security options, market scope or contracted capacity.

Commercial / product rationale: ZoikoSuite is multi-dimensional; packaging must not force schema redesign when the commercial model evolves.

Engineering rule: subscription_item supports metric_type, entitlement_set_id, limits, add-ons, market scope and contract overrides. Telemetry alone cannot become a billable metric.

B3. Is a free plan or free trial assumed?

Decision: No.

Commercial / product rationale: Commercial truth must come from the approved catalog/evaluation program.

Engineering rule: Use EVALUATION_PROGRAM with duration, payment requirement, entitlement set, conversion policy and expiry action. No automatic charge without approved terms and payment authorization.

B4. How do upgrades work?

Decision: Immediate or scheduled according to catalog/contract after commercial preview and required authorization.

Commercial / product rationale: Capabilities should not race ahead of payment, contract approval, market eligibility or security prerequisites.

Engineering rule: Persist quote/preview, catalog version, effective_at, approver/customer consent and resulting entitlement version. Activate only after required prerequisites succeed.

B5. How do downgrades work?

Decision: At renewal by default, subject to compatibility and retention checks.

Commercial / product rationale: A downgrade can invalidate integrations, entities, workflows, AI allowances or retention/security options.

Engineering rule: Schedule downgrade; generate incompatibility report; block destructive remediation. Historical records and evidence are never deleted merely to fit a lower plan.

B6. How are bespoke enterprise terms handled?

Decision: Through approved contract/order-form overlays, not hidden code switches.

Commercial / product rationale: Enterprise terms may modify quantities, markets, support, data residency, integration scope and security commitments.

Engineering rule: Store contract_entitlement_overlay with effective dates, approval, legal reference, precedence and renewal behavior. Every runtime entitlement decision is explainable to a catalog/contract source.

B7. Can AI or integration usage create surprise charges?

Decision: No.

Commercial / product rationale: Operational telemetry is not commercial consent.

Engineering rule: A usage meter becomes billable only when meter_definition + catalog rate/allowance + disclosure + customer authorization + approved aggregation policy are active.

7. C. Capability, Module & Release Registry

Dimension	Question answered	Controlling object
Capability existence	Does the capability exist in the code/product model?	capability_registry
Commercial entitlement	Is this organization entitled under catalog/contract?	entitlement_service
Market availability	Is the capability approved in the organization/entity jurisdiction and language?	market_release_registry
Integration readiness	Are required connectors/providers certified and healthy?	integration_capability_registry
Security/privacy eligibility	Is the data class, residency, provider and tenant policy compatible?	policy engine
Operational release state	GA / BETA / PILOT / INTERNAL / DISABLED / INCIDENT_RESTRICTED	release_registry
Execution authority	May this actor/system perform the action now?	authorization + automation policy
Public claim eligibility	May Marketing/Sales describe the capability as available?	claim_registry

C1. Can the UI infer availability from plan alone?

Decision: No.

Commercial / product rationale: Entitlement is only one gate among market, provider, release, security and incident state.

Engineering rule: Capability resolution returns structured reason codes for enabled, unavailable, requires upgrade, market blocked, provider unavailable, permissions blocked or incident-restricted states.

C2. Can public marketing claim capabilities from engineering roadmap state?

Decision: No.

Commercial / product rationale: Roadmap, deployed code and approved public availability are different facts.

Engineering rule: Public claim service consumes only claim_registry entries linked to release evidence, market scope, wording owner, approval and expiry/review date.

C3. How are capability changes versioned?

Decision: Published capabilities and entitlement definitions are versioned and effective-dated.

Commercial / product rationale: Historical contractual and runtime behavior must be reproducible.

Engineering rule: Never edit a released entitlement or policy meaning in place. Create a new version with migration/compatibility rules and rollback target.

8. D. Connected Systems, Systems of Record & Data Authority

Domain	Authority rule
General ledger / ERP	Accounting system or Finance-approved ledger remains authoritative for posted accounting entries and financial statements unless explicitly migrated.
Payroll	Approved payroll engine/provider remains authoritative for calculated payroll results, statutory submissions and payment outcomes.
HR / HCM	Approved HR/HCM system remains authoritative for employment/master data where designated.
Billing / AR	Approved billing/invoicing system remains authoritative for issued invoices/payments where designated; Zoiko Billing may be a native source when connected.
Identity	Enterprise IdP / Zoiko identity service is authoritative for identity and authentication facts; ZoikoSuite owns product memberships and scopes.
Document repository	Source repository owns original file/version; ZoikoSuite stores governed references, hashes, approved copies or evidence snapshots according to policy.
Legal / compliance sources	Approved legal/regulatory/source registries govern obligation content and effective dates; model memory is never the authority.
ZoikoSuite	Authoritative for its own obligations, control definitions, workflow/case state, evidence acceptance, attestations, approvals, exceptions, policy versions and audit events.

D1. Can ZoikoSuite overwrite a connected system because its data appears stale?

Decision: No by default.

Commercial / product rationale: Staleness is an exception to reconcile, not permission to seize authority.

Engineering rule: Create data_quality_exception and source_conflict records. Apply documented precedence or route to owner; never silently back-write without an approved integration action.

D2. How are conflicting sources handled?

Decision: By field-level source precedence, freshness, verification and review policy.

Commercial / product rationale: Enterprise integrations frequently disagree during cutovers, timing gaps and manual corrections.

Engineering rule: source_authority_map defines source, field family, precedence, effective dates, conflict route and allowed correction path. Ambiguous material facts block downstream high-impact decisions.

D3. Can cached/derived data become authoritative?

Decision: Only for explicitly defined derived facts.

Commercial / product rationale: A cache improves performance but does not change provenance.

Engineering rule: Every derived value carries source refs, calculation/rule version, generated_at, expiry/freshness and authority_class = DERIVED. Historical replay uses original versions.

9. E. Obligation, Policy, Control & Compliance Model

E1. What is the core governance chain?

Decision: OBLIGATION → REQUIREMENT → POLICY/CONTROL → EVIDENCE/TEST → FINDING/EXCEPTION → REMEDIATION → REVIEW/ATTESTATION.

Commercial / product rationale: This prevents “compliance” from becoming an unexplained dashboard color.

Engineering rule: Persist scoped, versioned objects and links. Every status must be traceable to source, jurisdiction/entity, owner, evidence and review state.

E2. What makes an obligation applicable?

Decision: A versioned applicability decision based on jurisdiction, entity, activity, product/process, thresholds, dates and approved source rules.

Commercial / product rationale: Applicability is contextual and changes over time.

Engineering rule: Store applicability_decision with source/rule versions, effective dates, facts used, actor/system, confidence/uncertainty and review requirement. Unknown applicability does not default to NOT_APPLICABLE.

E3. Can a control be marked effective because it exists?

Decision: No.

Commercial / product rationale: Design existence and operating effectiveness are different.

Engineering rule: Separate DESIGN_STATUS and OPERATING_EFFECTIVENESS. Effectiveness requires test/evidence under an approved methodology and review cadence.

E4. What does COMPLIANT mean?

Decision: Only a scoped, defined status produced by an approved evaluation rule; it is not a universal legal guarantee.

Commercial / product rationale: Overbroad labels create legal and product risk.

Engineering rule: UI/reporting must show scope, as-of date, source coverage, exceptions, evidence freshness and limitations. Prefer “control status,” “obligation status” or “assessment status” where appropriate.

E5. Can users override control or obligation status?

Decision: Only through governed exception/override workflow.

Commercial / product rationale: Manual edits without reason or expiry destroy assurance value.

Engineering rule: Override requires reason, authority, scope, expiry/review, compensating control where applicable and immutable audit. High-risk overrides require second approval.

E6. How are attestations handled?

Decision: As signed/attributed assertions with scope and evidence, not automatic proof.

Commercial / product rationale: An attestation can be important but remains a representation by an identified actor.

Engineering rule: attestation stores statement/version, subject, period, signer, role, timestamp, evidence refs, expiry and challenge/revocation state.

10. F. Regional Intelligence, Jurisdiction & Effective-Date Governance

F1. Can one rule apply globally?

Decision: Only when an approved global rule explicitly has that scope.

Commercial / product rationale: Business, tax, employment, privacy, reporting and regulatory requirements vary by jurisdiction and entity.

Engineering rule: Every obligation/rule/policy has jurisdiction_scope, entity_scope, effective_from/to, source_version and supersession links. "GLOBAL" is an explicit scope, not a default.

F2. How are legal/regulatory changes introduced?

Decision: Through governed source intake, review, impact analysis, version release and effective-date activation.

Commercial / product rationale: A new publication should not instantly rewrite tenant obligations without validation.

Engineering rule: Change pipeline: source_received → validated → mapped → reviewed → approved → scheduled/active. Impacted tenants/processes are enumerated before activation.

F3. What if a market is unsupported or ambiguous?

Decision: Fail to unsupported/uncertain state and route appropriately.

Commercial / product rationale: Guessing jurisdictional applicability is unsafe.

Engineering rule: Use MARKET_UNSUPPORTED / JURISDICTION_UNCERTAIN states. Block definitive compliance claims and high-impact automation until resolved.

F4. Can translated regulatory content be authoritative automatically?

Decision: No.

Commercial / product rationale: Translation can change legal meaning.

Engineering rule: Translation has approval tier, source-language reference, reviewer and allowed-use. High-impact use may require approved localized source or human review.

F5. How are time-zone and legal-day rules handled?

Decision: From market/entity calendars and explicit policy.

Commercial / product rationale: Deadlines and effective dates can depend on local time, holidays and business-day conventions.

Engineering rule: deadline_rule stores timezone, calendar, holiday source, cutoff semantics, rule version and exception path. Never rely on application server timezone.

11. G. AI, Agentic Automation & Human Authority

AI GOVERNANCE DOCTRINE

ZoikoSuite may use AI to reduce analysis and operating work, but the platform must never confuse model capability with organizational authority. The deterministic policy layer, source/evidence state, actor permissions, approved tool registry, tenant automation policy and required human approvals outrank model preference.

G1. What may AI do by default?

Decision: Classify, summarize, extract, compare, draft, prioritize, recommend and explain within approved data/source scope.

Commercial / product rationale: These activities can deliver value without silently creating irreversible business effects.

Engineering rule: AI outputs carry model/prompt/tool versions, source/evidence refs, confidence/limitation metadata and audit IDs where material.

G2. What actions require heightened controls?

Decision: Any action affecting money, employment, tax/filing, legal position, external certification, access/security, contractual commitment, record deletion, retention/legal hold or regulated reporting.

Commercial / product rationale: These actions can create irreversible legal, financial or human consequences.

Engineering rule: Require action risk class, deterministic preconditions, explicit permission, maker-checker/human approval where defined, idempotency, postcondition verification and rollback/compensation plan.

G3. Can an AI agent change a policy or control definition?

Decision: Not silently.

Commercial / product rationale: Policy changes alter governance truth across tenants and historical evaluation.

Engineering rule: Agent may draft changes; publication requires versioned change request, impact analysis, authorized approval, tests and release record.

G4. Can AI mark an obligation compliant?

Decision: Only if a deterministic approved rule defines that status and all required evidence/test conditions are met.

Commercial / product rationale: Model narrative is not assurance evidence.

Engineering rule: AI may recommend status or identify evidence gaps; final status engine uses policy/rule logic and any required reviewer decision.

G5. What happens when AI is uncertain or sources conflict?

Decision: Route to clarification, limitation or review; do not infer certainty from fluent output.

Commercial / product rationale: Uncertainty is a real system state.

Engineering rule: Use classification/risk states including UNCERTAIN/CONFLICT/NO_SOURCE where applicable. High-impact actions fail closed.

G6. Can external model providers train on tenant data by default?

Decision: No default training use is authorized.

Commercial / product rationale: Business, financial, HR and legal data require purpose limitation and provider governance.

Engineering rule: Provider registry must verify training-use posture, retention, region, DPA/subprocessors and approved data classes before production calls.

G7. How are autonomous actions allowed?

Decision: Through explicit action-policy allowlists per tenant, role, risk class and tool.

Commercial / product rationale: "Agentic" must be a controlled execution model, not broad delegated authority.

Engineering rule: automation_policy defines action, preconditions, max scope/amount, required approvals, dry-run/preview, idempotency, time window, rate/volume limits, kill switch and audit event set.

12. H. Workflow, Cases, Approvals, Tasks & Escalation

H1. What is the canonical workflow lifecycle?

Decision: DRAFT → ACTIVE → WAITING/IN_REVIEW → COMPLETED / CANCELED / FAILED, with separate exception and approval dimensions.

Commercial / product rationale: One status cannot safely represent work, approval, evidence and exceptions.

Engineering rule: Model work_state, approval_state, evidence_state, risk_state and exception_state separately where needed; user-facing status is composed.

H2. How are approvals modeled?

Decision: As explicit decision objects linked to requested action, scope, evidence and policy.

Commercial / product rationale: An approval must be replayable and revocable/expired where appropriate.

Engineering rule: approval records requester, approver, role, decision, reason, object/action, threshold, evidence refs, decided_at, expires_at and self-approval check.

H3. Is maker-checker mandatory everywhere?

Decision: No; it is risk/threshold driven.

Commercial / product rationale: Universal dual approval creates friction while no approval creates risk.

Engineering rule: approval_policy determines when second-person approval is required by action, risk class, amount/scope, tenant and market. Self-approval attempts are blocked and evented.

H4. How are exceptions handled?

Decision: As first-class objects with owner, severity, due date, risk, evidence and resolution.

Commercial / product rationale: A failed control or integration must not disappear into notification history.

Engineering rule: exception record includes source, affected obligation/control/workflow, materiality, owner, SLA/due date, remediation, approval and closure evidence.

H5. What happens when a task becomes obsolete after source state changes?

Decision: Re-evaluate and supersede/suppress the task where policy allows.

Commercial / product rationale: Users should not act on stale generated work.

Engineering rule: Workflow decision engine checks authoritative state before execution/reminder. Supersession preserves the original task and reason rather than deleting history.

13. I. Evidence, Auditability, Attestations & Control Testing

11. What qualifies as evidence?

Decision: A governed evidence object with provenance, subject/scope, period, source, integrity metadata, access classification and review status.

Commercial / product rationale: Uploading a file is not enough to establish evidentiary relevance or authenticity.

Engineering rule: evidence_object stores source_system, source_ref, hash/version, acquired_at, subject, period, data_class, retention, license/export rights, reviewer state and links to controls/obligations.

12. Can evidence be edited in place?

Decision: Source metadata may be corrected under audit; original evidence bytes/snapshot cannot be silently overwritten.

Commercial / product rationale: Historical assurance depends on chain of custody.

Engineering rule: Use version/append model; preserve original hash and supersession/revocation reason. Derived extracts link to source evidence and transformation version.

13. How are control tests represented?

Decision: As repeatable test definitions and executions.

Commercial / product rationale: A control result without method, sample and evidence cannot be reproduced.

Engineering rule: control_test_execution stores test_definition_version, period, population/sample, procedure, evidence refs, tester, result, exceptions, reviewer and timestamps.

14. Can AI-generated evidence summaries substitute for source evidence?

Decision: No.

Commercial / product rationale: Summary improves usability but is not the source.

Engineering rule: AI summaries are DERIVED artifacts, linked to evidence refs, model/prompt version and confidence. Review/export must preserve access to authorized source evidence or clearly state limitations.

15. What makes the audit trail production grade?

Decision: Append-preserving, versioned, tenant-scoped, tamper-evident/replayable and complete for material events.

Commercial / product rationale: A mutable activity log is not enough for regulated operating evidence.

Engineering rule: Use transactional outbox/equivalent, immutable event IDs, schema versions, correlation/causation, actor, scope, before/after references, reason, timestamps and integrity verification.

14. J. Documents, Records, Retention, Legal Hold & Exports

J1. How is retention determined?

Decision: By record type, tenant contract, jurisdiction, legal/regulatory need, source rights, privacy obligations and legal hold.

Commercial / product rationale: One global retention period is unsafe.

Engineering rule: Version retention_policy; every purge checks legal hold, record class, minimum/maximum rules and source-system ownership before deletion/redaction.

J2. Does account cancellation delete records?

Decision: No automatic destructive deletion of governed records.

Commercial / product rationale: Financial, legal, HR and compliance evidence may need retention or export.

Engineering rule: Separate access state, commercial subscription state and data-retention state. Closure launches retention/offboarding workflow.

J3. How does legal hold behave?

Decision: It blocks deletion/redaction actions covered by the hold until authorized release.

Commercial / product rationale: Ordinary lifecycle automation must not defeat preservation duties.

Engineering rule: legal_hold specifies scope, custodians/objects, authority, start, status and release approval. Hold checks occur in deletion/export/migration paths.

J4. How are exports controlled?

Decision: By role, purpose, data class, recipient scope, source rights, legal hold and market rules.

Commercial / product rationale: Exports can become the largest uncontrolled data exfiltration surface.

Engineering rule: Export job uses preview/manifest, approval for restricted classes, watermark/classification where required, asynchronous secure generation, expiry and audit event.

J5. Can generated Word/PDF packs imply certification?

Decision: Only when an approved assurance/attestation workflow permits the exact wording.

Commercial / product rationale: A professional-looking document can be mistaken for legal or audit certification.

Engineering rule: Template registry separates operational reports, evidence packs, attestations, certifications and drafts. External assurance wording requires Legal/Compliance approval and authorized signatory.

15. K. Accounting, Tax, HR, Payroll & Billing Boundaries

Domain	Boundary
Accounting	ZoikoSuite may orchestrate controls, evidence, reconciliation, review and decision intelligence. It is not automatically the general ledger or authoritative financial statement engine.
Tax	ZoikoSuite may track obligations, source facts, evidence, workflows and integrations. It does not promise universal tax advice, calculation, filing or compliance unless a market-specific released capability explicitly does so.
HR	ZoikoSuite may govern employment-related controls/workflows and integrate HR data. It does not silently replace Zoiko HR or an external HCM system.

Domain	Boundary
Payroll	ZoikoSuite may govern payroll controls, deadlines, evidence and exceptions. It does not silently recalculate or become the payroll engine unless an explicit approved integration/service owns that action.
Billing	ZoikoSuite may govern revenue-operations controls and integrate Zoiko Billing or external billing systems. Tenant invoices/payments remain owned by the authoritative billing source.
Legal/Compliance	ZoikoSuite supports legal/compliance operations and evidence. It does not represent AI output as legal advice or regulatory approval.
ZoikoLogia / Kriton	Where integrated, ZoikoLogia/Kriton source-backed intelligence transfers only through approved scopes; downstream ZoikoSuite inherits applicable classification, retention and evidence constraints.

K1. Can ZoikoSuite normalize data from these domains?

Decision: Yes, into governed operational facts.

Commercial / product rationale: Cross-domain intelligence requires a common model without corrupting source authority.

Engineering rule: normalized_fact retains source_system, source_record, source_version, observed_at, effective_at, transformation version and authority class.

K2. Can one executive dashboard combine all domains?

Decision: Yes, with explicit definitions and traceability.

Commercial / product rationale: CFO/GC/CIO value comes from cross-domain visibility, but aggregation can mislead.

Engineering rule: Each metric declares source, scope, freshness, currency/entity treatment, calculation version and whether it is operational, accounting, legal or estimated.

16. L. Integrations, API, Webhooks, Idempotency & Import Controls

L1. Are material mutation APIs idempotent?

Decision: Yes whenever retries could duplicate or repeat a consequential action.

Commercial / product rationale: Distributed systems retry; governance automation must not multiply effects.

Engineering rule: Require idempotency key or deterministic operation key for creates/approvals/executions/exports. Persist fingerprint and prior result.

L2. How are outbound webhooks delivered?

Decision: Signed, versioned, at-least-once, tenant-scoped and replayable.

Commercial / product rationale: Consumers need verification and safe dedupe.

Engineering rule: Envelope includes event_id, event_type, schema_version, tenant/workspace, environment, occurred_at, resource refs and signature. Replays preserve identity or explicit replay metadata.

L3. Can a connector write directly to core tables?

Decision: No.

Commercial / product rationale: Direct database coupling bypasses authorization, validation, audit and source precedence.

Engineering rule: All integrations use versioned service/API/event contracts. Shared database writes across product boundaries are prohibited.

L4. How are bulk imports handled?

Decision: Stage → validate → preview → approve where required → commit idempotently → reconcile.

Commercial / product rationale: A malformed import can corrupt control state at scale.

Engineering rule: Batch ID, schema version, row errors, dedupe, dry-run, source mapping, approval threshold and correction strategy are mandatory. Rejected rows remain visible.

L5. How are integration failures represented?

Decision: As explicit health/exceptions; they do not silently mutate governance truth.

Commercial / product rationale: A failed connector is not proof a control failed or passed.

Engineering rule: integration_job and connection_health are separate from obligation/control state. Downstream high-impact decisions check freshness and health before use.

L6. How are provider credentials managed?

Decision: Through centrally governed secret references and narrowly scoped OAuth/service identities.

Commercial / product rationale: Credentials are a high-impact administrative surface.

Engineering rule: No secrets in application logs, support tickets, exports or tenant-visible webhooks. Credential changes require step-up, approval where material, notification and audit.

17. M. Reporting, Executive Intelligence & Analytics Boundaries

M1. What is an executive score?

Decision: A governed derived metric with explicit definition, components, scope and limitations.

Commercial / product rationale: Composite scores can obscure evidence gaps or create false precision.

Engineering rule: metric_definition stores formula/version, inputs, weights, missing-data behavior, owner, approval and display wording. Users can drill to source facts and exceptions.

M2. Can “risk” be one global number?

Decision: Only as an approved summary, never as the underlying truth.

Commercial / product rationale: Legal, financial, security, operational and control risk are heterogeneous.

Engineering rule: Keep risk domains and drivers separately queryable. Summary score shows uncertainty, data freshness and excluded dimensions.

M3. Can dashboards call a control “verified” when evidence is stale?

Decision: No.

Commercial / product rationale: Evidence freshness and test period matter.

Engineering rule: Status composition evaluates evidence freshness, test validity, open exceptions and review expiry at read time. Stale status becomes EXPIRED/REVIEW_REQUIRED/UNKNOWN per policy.

M4. Can operational dashboards be treated as financial statements?

Decision: No.

Commercial / product rationale: Cross-domain operational intelligence is not a substitute for Finance-controlled accounting reports.

Engineering rule: Metrics use precise labels; Finance-controlled metrics explicitly identify accounting source and close/version. No “recognized revenue,” “cash,” or statutory figure without approved accounting definition.

M5. How should persona views differ?

Decision: They use the same governed source objects but different lenses and action priorities.

Commercial / product rationale: Separate data models for CFO/GC/CIO would create conflicting truth.

Engineering rule: Persona views are projections over shared objects/permissions: CFO emphasizes finance/control/obligation economics; GC emphasizes legal/compliance obligations, evidence and exceptions; CIO emphasizes systems, integrations, security, data and operational resilience.

18. N. ZoikoSuite Subscription Billing — Zoiko Charges to Customers

N1. What system bills customers for ZoikoSuite itself?

Decision: A dedicated commercial-account/subscription layer integrated with approved processor/Finance invoicing paths.

Commercial / product rationale: ZoikoSuite monetization must remain distinct from tenant business-operation records.

Engineering rule: commercial_account + commercial_subscription + price_catalog + commercial_invoice/payment are separate from tenant governance, evidence and connected financial records.

N2. What is the billing metric?

Decision: Catalog-defined.

Commercial / product rationale: The approved commercial model may evolve across users, entities, capabilities, integrations, AI/automation, records or contracted capacity.

Engineering rule: Model subscription_item.metric_type generically; charge only APPROVED metrics with explicit allowance/rate and customer authorization.

N3. Can internal platform telemetry determine the invoice directly?

Decision: Not without a governed commercial meter.

Commercial / product rationale: Telemetry may be noisy, late, duplicated or non-billable.

Engineering rule: commercial_usage_meter is a separate Plane 1 ledger with event IDs, validation, dedupe, aggregation window and billable state.

N4. Are third-party provider fees automatically Zoiko revenue?

Decision: No.

Commercial / product rationale: Cloud, model, tax, data, e-signature or integration-provider economics differ from platform subscription economics.

Engineering rule: Tag fee_source and present/contract third-party charges separately unless approved bundle terms explicitly include them.

N5. Can ZoikoSuite use its own operational objects as subscription invoices?

Decision: No domain collapse.

Commercial / product rationale: Dogfooding may reuse services, but commercial entitlement and financial identity must remain separate.

Engineering rule: If shared invoice infrastructure is used, isolate legal seller, namespace, ledger, sequence, processor mapping, access controls, reconciliation and kill switch.

N6. How is cancellation handled?

Decision: At period end by default for self-service unless catalog/contract states otherwise; preserve export/retention obligations.

Commercial / product rationale: Immediate destructive shutdown can strand critical records.

Engineering rule: Store cancel request/effective dates, reason, actor, contract rule, retention/offboarding state and Zoiko One relationship.

19. O. Failed Payments, Dunning, Restriction & Termination

O1. What happens after ZoikoSuite's own payment fails?

Decision: Governed recovery, not immediate data loss.

Commercial / product rationale: Business-governance records are operationally sensitive and may be needed during a billing dispute.

Engineering rule: Commercial state becomes PAST_DUE; retry/notice starts. Restriction milestones are policy/catalog/contract controlled; this document does not invent day counts absent final approval.

O2. What remains available while restricted?

Decision: Essential account/billing remediation, critical history and permitted export/read access according to policy.

Commercial / product rationale: Customers must be able to understand obligations and retrieve records without continuing paid operational expansion.

Engineering rule: Entitlement state PAST_DUE/RESTRICTED/SUSPENDED is independent of data-retention state and underlying connected-system truth.

O3. Does successful retry restore access automatically?

Decision: Yes when authoritative payment/reconciliation confirms it and contract permits.

Commercial / product rationale: Manual restoration after normal recovery creates unnecessary friction.

Engineering rule: Entitlement service consumes commercial payment events idempotently; restoration is logged and does not re-run tenant workflows.

O4. Can tenant control failures or compliance exceptions suspend ZoikoSuite for nonpayment?

Decision: No.

Commercial / product rationale: Product subscription and tenant governance outcomes are separate planes.

Engineering rule: No event path from tenant control/obligation state to commercial_subscription suspension except explicit safety/legal/abuse controls unrelated to payment.

20. P. Zoiko One Bundling, Cross-Sell & Double-Charge Prevention

P1. Can ZoikoSuite be purchased without Zoiko One?

Decision: Yes.

Commercial / product rationale: Commercial independence is part of the platform strategy.

Engineering rule: Standalone onboarding, pricing, contract, support, docs, analytics and legal routes cannot require a Zoiko One subscription.

P2. Can Zoiko One provide ZoikoSuite entitlement?

Decision: Yes where bundle/contract includes it.

Commercial / product rationale: Native distribution should not force a duplicate purchase.

Engineering rule: billing_source = ZOIKO_ONE_BUNDLE with bundle/contract ref. Disable direct checkout for identical overlapping entitlement unless approved migration/upgrade path is active.

P3. How is standalone ↔ Zoiko One migration handled?

Decision: Through an effective-dated commercial transfer.

Commercial / product rationale: Silent overlap creates double charging and entitlement drift.

Engineering rule: transfer record maps old/new billing source, cancellation/creation dates, entitlement continuity, credits if needed and reconciliation. No overlap without explicit contract logic.

P4. Can shared services be reused?

Decision: Yes where approved.

Commercial / product rationale: Commercial separation does not require wasteful duplication of identity, notifications, audit, integrations or common infrastructure.

Engineering rule: Shared services expose versioned tenant-scoped contracts. ZoikoSuite retains independent catalog, entitlements, product analytics, support, documentation and commercial account.

P5. Can ZoikoSuite data merge automatically with other Zoiko products?

Decision: No.

Commercial / product rationale: Native integration is valuable but must respect purpose, permissions and data authority.

Engineering rule: Cross-product data transfer requires integration entitlement, source/recipient scopes, classification, minimization, audit and revocation. Shared tenant identity does not equal shared data permission.

21. Q. Global Market Availability, Data Residency & Localization

Q1. What does “global” mean?

Decision: Architecturally capable of multi-jurisdiction operation under verified market configuration.

Commercial / product rationale: Global architecture is not proof of legal or commercial availability everywhere.

Engineering rule: market_release_registry gates country/region, entity, language, data residency, provider, source content, claims, integrations and support readiness.

Q2. How is data residency enforced?

Decision: Through policy plus infrastructure routing/storage controls.

Commercial / product rationale: A dropdown preference without technical enforcement is not residency.

Engineering rule: Every data class resolves allowed regions/providers/storage/backup/export routes before processing; incompatible paths fail closed or require approved exception.

Q3. How are cross-border transfers handled?

Decision: Through approved transfer/legal mechanism and provider/region eligibility.

Commercial / product rationale: International data movement can create obligations independent of application function.

Engineering rule: transfer_policy records source/destination, data class, provider, mechanism/evidence, tenant contract, approval and re-verification trigger.

Q4. How are localized UI and content released?

Decision: Through language/terminology QA and market claim review.

Commercial / product rationale: Translation quality can affect legal meaning and user trust.

Engineering rule: localization_release records language, market, reviewed strings, terminology glossary, accessibility result and claim approval. No machine-only publication of high-impact legal/compliance content.

22. R. Security, Privacy, AI Data Use & Provider Governance

Control area	Minimum standard
Tenant isolation	Every tenant-scoped object, query, cache, index, file, event, export and analytic path enforces tenant scope. Cross-tenant access is denied and auditable.
Least privilege	Permissions are role + tenant/workspace/entity + data-class + action scoped; deny precedence applies.
Privileged administration	Step-up authentication, just-in-time or time-bounded privilege, break-glass reason/expiry/review and customer-auditable access where appropriate.
Encryption/secrets	Encrypt in transit and at rest; store credentials in approved secrets systems; never expose secrets in logs, prompts, exports or support tooling.
Provider governance	Provider use requires exact-use approval, security/privacy review, region eligibility, retention/training posture, subprocessor visibility, incident terms and offboarding path.

Control area	Minimum standard
AI data minimization	Only minimum approved context may enter model/tool paths; PII/confidential fields are redacted/tokenized/withheld where not required.
Training / secondary use	No default use of tenant data for model training or secondary analytics beyond approved purpose.
Secure SDLC	Threat modeling, code/dependency/secret/IaC scanning, review gates, penetration testing and remediation evidence before applicable production release.
Accessibility	User-facing surfaces target WCAG 2.2 AA-equivalent product standard; accessibility must not create security or data-protection bypasses.

R1. Can Support impersonate a tenant admin?

Decision: Only through explicit, visible, time-bounded support access where enabled.

Commercial / product rationale: Support troubleshooting must not become hidden privileged access.

Engineering rule: Impersonation records original actor, customer/tenant authorization where required, scope, reason, start/end, actions and prohibits approval/signature actions not explicitly delegated.

R2. Can provider/model changes occur silently?

Decision: No for material provider/model behavior or data-handling changes.

Commercial / product rationale: Vendor changes can affect privacy, quality, cost and risk.

Engineering rule: Provider/model registry has version, evidence, review triggers and production authorization token. Material change suspends affected use until re-evaluated or approved.

R3. How are data subject/privacy requests handled?

Decision: Through governed workflows respecting source-system authority and legal holds.

Commercial / product rationale: ZoikoSuite may hold references, derived data and copies while underlying source systems hold originals.

Engineering rule: DSR workflow inventories ZoikoSuite + connected-source responsibilities, executes permitted actions, records exceptions/holds, and reconciles completion evidence.

23. S. Communications, Notifications, Portals & Delivery Evidence

S1. What communication estates should be separated?

Decision: At minimum: ZoikoSuite product/service, ZoikoSuite commercial account, tenant-governed workflow notifications, and internal operations/security.

Commercial / product rationale: Sender/audience/purpose separation protects trust, privacy and deliverability.

Engineering rule: Each estate has sender policy, template registry, audience scope, suppression/collision rules, retention and reputation boundary.

S2. Can a notification infer a legal/compliance state?

Decision: No.

Commercial / product rationale: Rendering code must not become policy logic.

Engineering rule: Templates receive approved state/value payloads and resource refs. They never calculate compliance, deadlines, financial amounts or approval state.

S3. Does “delivered” mean the user accepted or acted?

Decision: No.

Commercial / product rationale: Transport evidence is not acknowledgement or approval.

Engineering rule: Store provider delivery evidence separately from viewed, acknowledged, approved, signed or completed user actions.

S4. How are external portal links secured?

Decision: Authenticated or short-lived purpose-scoped tokens with revocation and anti-enumeration.

Commercial / product rationale: Governance evidence and reports can contain highly sensitive data.

Engineering rule: Token embeds/links only opaque refs, expires, is resource/audience scoped, step-up for sensitive actions and is auditable.

24. T. Internal, Demo, Pilot, Sandbox & Existing Workspaces

billing_classification	Purpose	Commercial rule
COMMERCIAL_STANDALONE	Direct ZoikoSuite customer	May charge under approved catalog/contract.
COMMERCIAL_ZOIKO_ONE	Entitled through Zoiko One	No duplicate direct charge for same entitlement period; billing source references bundle/contract.
LEGACY_MIGRATION	Existing customer being normalized	Controlled mapping/reconciliation; no new live charge until commercial source is approved.
PILOT_NON_BILLABLE	Authorized evaluation/pilot	No recurring live charge unless the pilot order expressly authorizes it.
INTERNAL	Zoiko internal use	No external customer charge; internal cost allocation does not masquerade as customer billing.
DEMO	Sales/product demonstration	Synthetic/de-identified data; no live high-impact execution or customer communications.
SANDBOX	Developer/customer sandbox	Synthetic/test integrations; no production settlement, filings, HR actions or external certifications.
QA_AUTOMATION	Automated testing	Synthetic only; isolated queues, model/provider test routes, webhooks and communications.

T1. Can environment name determine billing or execution safety?

Decision: No.

Commercial / product rationale: Production can contain demos/pilots; staging can still accidentally connect to live services.

Engineering rule: Commercial charge and high-impact execution both require explicit classification + entitlement/policy + environment + provider/source eligibility. Environment is one control, never the only one.

T2. How are existing workspaces migrated?

Decision: Inventory → classify → map commercial source → map capabilities → map entities/regions → validate integrations/data authority → reconcile → dry run → sign off.

Commercial / product rationale: ZoikoSuite has established platform architecture, so migration risk is first-class.

Engineering rule: Produce per-tenant migration manifest and exception register. Missing classifications or source authority mappings block commercial activation.

25. U. Operating Ownership, Change Control & Commercial Governance

Owner	Accountability
Product / Commercial	Category, packaging, catalog proposals, entitlements, buyer journeys, market offers, roadmap and claim intent.
Finance / Billing Operations	Merchant setup, ZoikoSuite subscription invoices/payments, credits/refunds, reconciliation, close and commercial controls.
Legal / Compliance	Market claims, obligation-source governance, contractual terms, regulated wording, privacy/legal basis, professional boundaries, retention/legal hold.
Data Governance	Canonical data definitions, source authority, lineage, evidence schemas, quality rules, retention metadata and semantic control.
Engineering / Architecture	Service boundaries, tenant model, policy/evidence/workflow services, integration contracts, eventing, idempotency, migrations and reliability.
AI/ML / AI Governance	Model/provider routing, evaluation, prompts/tools, risk classification, human-review triggers, autonomous-action scope, regression and drift controls.
Security / Privacy	IAM, secrets, tenant isolation, provider review, data minimization, residency, incident response, secure SDLC.
QA	State-machine, negative/adversarial, migration, integration, security/privacy, AI evaluation and production acceptance evidence.
Customer Success / Support	Implementation guidance, case triage and customer operations without implicit authority to change commercial/legal/control truth.
Solutions / Partnerships	Certified integration patterns, partner scope, implementation boundaries, commercial handoff and unsupported-use prevention.

U1. Can an approved catalog or entitlement be edited in place?

Decision: No.

Commercial / product rationale: Historical subscriptions and customer commitments must remain reproducible.

Engineering rule: Create new catalog/entitlement version with effective dates, migration rules and approvals. Existing customers stay on referenced version until governed transition.

U2. What is required for emergency overrides?

Decision: Named approver, reason, exact scope, expiry, customer/market impact, compensating controls and rollback/review plan.

Commercial / product rationale: Emergency operation must not create permanent invisible governance drift.

Engineering rule: Override object is time-bounded, evented and cannot bypass immutable data, legal hold, tenant isolation or prohibited actions.

U3. Who may change payment, provider, data-residency or high-impact execution configuration?

Decision: Only tightly restricted roles under dual control where risk warrants.

Commercial / product rationale: These changes can redirect money/data or enable consequential actions.

Engineering rule: Step-up MFA, change ticket, dual approval, secret vault, destination/region allowlists where feasible, notification and post-change reconciliation are mandatory.

26. Canonical RBAC & Segregation-of-Duties Matrix

Role	Zoiko subscription	Config	Workflows/controls	Evidence	Approvals	High-impact actions	Reports	Control note
Organization Owner	Yes	Admin	Scoped	Scoped	Approve by policy	Policy/threshold	Yes	Cannot bypass SoD/high-impact policy simply by being Owner.
ZoikoSuite Admin	Yes	Admin	Admin	Admin	Approve by policy	Policy/threshold	Yes	Product/tenant administration; commercial and high-impact permissions remain explicit.
Governance / Compliance Admin	No by default	View	Admin	Admin	Approve scoped	No	Yes	Owens obligations, controls, evidence, findings; no subscription payment authority by default.
Finance / Controller	No by default	View	Scoped	Scoped finance	Approve scoped	Financial actions if granted	Yes	No legal/security admin unless separately granted.
Legal / Compliance Reviewer	No	View	Review	Review	Approve scoped	No	Yes	Reviewer and exception authority within assigned domains.
Control Owner	No	View	Scoped manage	Submit evidence	Request	No	Scoped	Cannot approve own material exception where maker-checker applies.
Evidence Contributor	No	No	Task only	Upload/submit	No	No	Limited	Cannot accept own evidence as sufficient unless policy explicitly allows.

Role	Zoiko subscription	Config	Workflows/controls	Evidence	Approvals	High-impact actions	Reports	Control note
CIO / Integration Admin	No	View	Integration config	No	No	No	Technical	Keys/webhooks/connections; cannot certify business compliance.
AI / Automation Admin	No	View	Automation config	No	No	No	Technical	Cannot expand autonomous action scope without policy approval.
Auditor / Read Only	No	View	View	View	View	No	View/export scoped	No mutation; exports follow data-class controls.
Support Agent	No	Limited	Limited	Limited	No	No	Case data	No policy, evidence-acceptance, payment, legal, provider or credential authority.
Zoiko Platform Ops	Platform scope	Platform	No tenant business mutation without approved path	No tenant acceptance	No tenant approval	Platform commercial only	Operational	Break-glass is time-bounded, audited and customer-visible where appropriate.

SEGREGATION-OF-DUTIES DOCTRINE

The ability to configure a workflow does not imply authority to approve its outcome. The ability to upload evidence does not imply authority to accept that evidence. The ability to integrate an ERP does not imply authority to change accounting data. The ability to administer ZoikoSuite does not imply authority to change subscription payment details, approve a legal position, release a legal hold, or expand AI autonomous-action scope. Role composition is explicit, server-side and threshold-aware.

27. Mandatory Production Acceptance Checklist

ID	Acceptance criterion
COM-01	Final pricing/plan/catalog/limits/add-ons/trial posture are approved and one catalog version drives web, app, Zoiko One, processor, contracts, support and renewal.
COM-02	Every workspace has billing_classification and billing_source; non-commercial classes cannot create live Zoiko charges.
COM-03	Standalone and Zoiko One entitlements cannot double charge the same scope/period.

ID	Acceptance criterion
PROD-01	Capability, entitlement, market, release, integration, execution and public-claim states are separately modeled and tested.
DATA-01	System-of-record/field authority matrix is approved for every production integration; source conflict paths exist.
GOV-01	Obligation/control/evidence/status semantics are versioned, scoped and reproducible; no generic “compliant” state exists without defined evaluation.
GOV-02	Control design, operating effectiveness, evidence freshness, exceptions and attestations are distinct.
AI-01	AI risk classes, source/evidence rules, review triggers, tool allowlist and autonomous-action policies are approved and evaluated.
AI-02	High-impact actions require deterministic preconditions, authority, idempotency, required approval, postcondition verification and audit.
AI-03	Provider/model/prompt/tool changes pass evaluation and production authorization; tenant data is not used for training by default.
SEC-01	Tenant isolation, MFA/step-up, privileged access, break-glass, secrets, SSO/SCIM where released and access review pass Security review.
PRIV-01	Purpose, data class, retention, legal hold, residency/transfer, DSR and provider processing rules are implemented for launch markets.
INT-01	Imports, webhooks and material mutations are idempotent; connection failures do not silently alter governance truth.
INT-02	No product or connector writes directly into another product’s core tables; all shared behavior uses approved contracts/events/APIs.
AUD-01	Material state changes emit durable immutable/replayable audit events; integrity and historical replay tests pass.
EVID-01	Evidence provenance, hashing/version, source rights, access class, retention and review state are enforced.
REP-01	Executive metrics are defined, versioned, source-traceable and labeled so operational intelligence is not misrepresented as financial/legal assurance.
QA-01	Staging/sandbox uses synthetic or approved de-identified data and non-production provider credentials/endpoints.
QA-02	Negative tests cover cross-tenant access, stale sources, conflicting facts, rule changes, duplicate events, replay storms, missing evidence, AI uncertainty, approval bypass and double charging.
OPS-01	Backups, restore, regional failover where applicable, observability, incident response, provider disablement and action kill switches are tested.
LEGAL-01	Terms, privacy/DPA, market claims, professional boundaries, compliance wording, data transfers and public capability claims are approved.
A11Y-01	User-facing launch surfaces meet the approved accessibility gate and do not introduce security/privacy bypasses.
GO-01	Product, Commercial, Engineering, Finance, Security, Privacy, Legal/Compliance, Data Governance, AI/ML and QA sign the go-live record.

28. Minimum Engineering Data Model

Object	Minimum fields / control purpose
organization	organization_id, name, state, locale, default_timezone, billing_classification, billing_source, created_at
commercial_account	commercial_account_id, organization_id, legal customer name, billing/tax facts, currency, contacts, processor refs, contract refs, status
commercial_subscription	subscription_id, commercial_account_id, plan_id, catalog_version_id, interval, items/metrics, status, renewal/cancel, processor/order refs
price_catalog / entitlement_set	catalog_version_id, plan/display, prices/currencies/intervals, limits, add-ons, meters, evaluation terms, market scope, approval/effective dates
workspace / legal_entity / business_unit	IDs, organization relation, legal/entity metadata, market, timezone, data region, status, entitlement scope
membership / role_scope	actor, org/workspace/entity scope, role/permissions, data class, status, effective dates, source
capability_registry	capability_id, version, module/domain, dependencies, release state, execution risk class, claim key
market_release_registry	market, capability, entity/data class, language, provider/integration prerequisites, legal approval, state/effective dates
system_source / source_authority_map	source system, domain/field family, authority class, precedence, freshness SLA, correction/conflict path
normalized_fact	fact_id, subject, value/unit, source refs/version, authority class, observed/effective times, transformation version, quality state
obligation / requirement	source/rule/version, jurisdiction/entity/activity scope, effective dates, applicability logic/status, owner
policy / control	control_id/version, control type, owner, frequency, design status, test/evidence requirements, automation policy
applicability_decision	obligation, subject scope, facts used, rule/source versions, decision, uncertainty, reviewer, effective period
workflow / case / task	workflow/case/task IDs, type/version, subject, owner, states, due date, priority, dependencies, correlation
approval / exception / remediation	action/object scope, requester/approver, threshold, reason, evidence, status, due/expiry, remediation links
evidence_object	evidence_id, source, hash/version, subject/period, data class, rights, retention, reviewer state, integrity refs
control_test_definition / execution	version, method, population/sample, period, evidence, tester/reviewer, result, findings, exceptions
attestation	statement/version, subject/period, signer/role, evidence refs, signed_at, expiry/revocation
AI run / recommendation	model/provider/prompt/tool versions, source/evidence refs, risk class, confidence/limitations, output hash, review state
automation_action	action_id, policy/version, requested/proposed/executed state, tool, preconditions, approvals, idempotency, result/rollback
integration_connection / job	provider/system, account/env, scopes, secret ref, health, market/data region, sync cursor, job state/errors

Object	Minimum fields / control purpose
webhook_event / outbox	event_id, direction, schema version, tenant/scope, resource, retry/replay, signature, idempotency
retention_policy / legal_hold	record class, jurisdiction, rule/duration, hold scope, effective version, release authority
report_metric_definition	metric_id/version, inputs/formula, scope, owner, accounting/legal classification, missing-data behavior, display rules
commercial_usage_meter	Plane 1 metric events, quantity/unit/window, source, dedupe, validation, billable state, catalog linkage
audit_event / replay_manifest	actor, role, tenant/scope, event/object, schema version, before/after refs, reason, correlation/causation, integrity, replay completeness

29. Canonical State Machines & Event Rules

Dimension	States
Obligation applicability	UNASSESSED / APPLICABLE / NOT_APPLICABLE / UNCERTAIN / SUPERSEDED
Control design	DRAFT / REVIEW_REQUIRED / APPROVED / REJECTED / RETIRED
Control effectiveness	NOT_TESTED / EFFECTIVE / PARTIALLY_EFFECTIVE / INEFFECTIVE / INCONCLUSIVE / EXPIRED
Evidence	REQUESTED / SUBMITTED / VALIDATING / ACCEPTED / REJECTED / SUPERSEDED / EXPIRED / REVOKED
Exception	OPEN / TRIAGED / REMEDIATING / ACCEPTED_RISK / WAIVED / RESOLVED / REOPENED
Approval	NOT_REQUIRED / PENDING / APPROVED / REJECTED / EXPIRED / REVOKED
Workflow work state	DRAFT / ACTIVE / WAITING / IN_REVIEW / COMPLETED / FAILED / CANCELED
AI recommendation	GENERATED / LIMITED / REVIEW_REQUIRED / ACCEPTED / REJECTED / SUPERSEDED
Automation action	PROPOSED / VALIDATING / APPROVAL_PENDING / AUTHORIZED / EXECUTING / SUCCEEDED / FAILED / COMPENSATING / REVERSED / BLOCKED
Integration health	UNKNOWN / HEALTHY / DEGRADED / STALE / FAILED / SUSPENDED
Market release	INTERNAL / PILOT / BETA / GA / RESTRICTED / SUSPENDED / RETIRED
Commercial entitlement	EVALUATION / ACTIVE / PAST_DUE / RESTRICTED / SUSPENDED / CANCELED / TERMINATED

- Do not compress independent dimensions into one universal status. A control can be APPROVED in design, INEFFECTIVE in operation, supported by EXPIRED evidence and have an OPEN remediation exception simultaneously.
- Every material state transition emits an immutable fact event only after successful transaction commit through an outbox/equivalent pattern.
- Event names describe facts: evidence.accepted, control_test.completed, exception.opened, approval.granted, automation_action.blocked, entitlement.restricted.
- Consumer retries are idempotent; consumer failure never re-executes the originating high-impact action.
- Analytics events are non-authoritative and cannot set compliance, entitlement, approval, evidence or execution states.

- Provider or source event ordering may be non-sequential. Consumers compare object version and event identity; contradictory material state routes to reconciliation rather than guessing.

30. Control Evaluation, Evidence Integrity & Assurance Standard

Assurance layer	Required meaning
Applicability	Proves why an obligation/requirement applies or does not apply to a scoped entity/process at an effective date.
Control design	Proves the defined control is capable, on paper, of addressing the mapped requirement.
Operating effectiveness	Proves the control operated as intended during a stated period using an approved test method and evidence.
Evidence sufficiency	Proves evidence is relevant, complete enough, fresh, authentic/provenanced and accessible to an authorized reviewer.
Exception materiality	Classifies finding severity and required remediation/approval; does not silently change control state.
Attestation	Records a named actor's assertion; may supplement but does not automatically replace objective evidence/test requirements.
Assurance output	Report/pack faithfully represents scope, limitations, exceptions, evidence freshness and reviewer/signatory authority.

Assurance packs and executive dashboards must expose “as of” date, entity/workspace scope, source/version set, coverage, open exceptions, stale/missing evidence, unresolved applicability and reviewer state. A percentage without this context is an operational convenience, not a defensible assurance conclusion.

31. Reconciliation, Lineage, Data Quality & Close Controls

Domain	Reconciliation relation	Cadence	Owner
Commercial subscriptions	Catalog/contract entitlement ↔ processor/Finance invoices ↔ payments/credits/refunds ↔ ZoikoSuite entitlement state	Daily automated + period close	Billing Operations
Connected facts	Source records ↔ normalized facts ↔ data freshness/quality ↔ downstream decisions	Continuous / per sync	Integration + Data Governance
Obligations	Source version ↔ rule/applicability version ↔ impacted entities/processes ↔ active obligations	On source/rule release + scheduled review	Legal/Compliance + Governance Ops
Controls/evidence	Control requirements ↔ evidence/test executions ↔ status ↔ exceptions/remediation	Continuous + review cycle	Control Owners + Reviewers
AI/automation	AI run/recommendation ↔ approved source/evidence ↔ action policy ↔ approval ↔ tool result/postcondition	Per action + monitoring	AI Governance + Product/Operations
Exports/reports	Underlying versioned facts ↔ metric/report version ↔ generated artifact hash/manifest	Per generation	Data Governance + Product
Zoiko One	Bundle entitlement ↔ direct ZoikoSuite commercial state ↔ transfer/migration records	Daily + renewal	Commercial Ops

- Exceptions are first-class records with owner, impact, source systems, aging, resolution code and audit history.
- Automated reconciliation may propose corrections but may not silently delete, backfill or overwrite authoritative records.
- Period close may freeze selected governance/reporting definitions for reproducibility while still allowing legitimate new evidence, incident response and corrective events with explicit post-close dating.
- Dashboards distinguish missing, stale, conflicting and reconciled data. Approximate or partially sourced values are labeled and never presented as exact statutory/accounting truth.

32. Observability, Reliability, Incident Controls & Kill Switches

Signal family	Required observability
Commercial integrity	Catalog mismatch, entitlement drift, double-billing risk, meter dedupe conflicts, processor/webhook lag, restoration failures
Tenant/data integrity	Cross-tenant denials, missing tenant scope, source freshness breach, conflicting authoritative facts, transformation errors
Governance engine	Obligation/rule activation failures, policy version mismatch, invalid state transitions, control evaluation errors
Evidence	Upload/hash failure, evidence expiry spikes, provenance gaps, acceptance/review backlog, replay integrity failure
AI/automation	Model/provider error, source-grounding gaps, uncertain classifications, blocked high-impact actions, approval bypass attempts, tool failure, abnormal autonomous-action rate
Integrations	Sync lag, webhook failure, auth expiry, schema drift, replay backlog, provider account mismatch
Privacy/security	Unauthorized export, role escalation, break-glass use, secret access, region violation, data minimization failure, provider policy mismatch
Reports/metrics	Metric definition drift, stale source percentages, partial-data warnings, generation failures, inconsistent replicas
Communications	Delivery/bounce, sender verification, suppression collision, queue backlog, sensitive-template policy failure

Numeric availability, latency, recovery, data-freshness and AI quality objectives must be approved from measured production capacity and business criticality before external commitment. This standard intentionally does not invent SLA percentages. Internal alerts, owners, severity models, runbooks and safe-degraded behavior are mandatory before go-live.

32.1. What kill switches are required?

Decision: Granular controls for commercial charging, high-impact automation/tool actions, model/provider use, obligation/rule activation, selected imports/syncs, outbound notifications/exports and public claim publication.

Commercial / product rationale: In an incident, stopping new harm must not require taking the whole platform offline.

Engineering rule: Kill switch is plane/domain/provider/tenant scoped, privileged, logged, approval-controlled, visible in operations, and has reconciliation/restart procedure. It does not erase already-committed history.

32.2. What is safe degraded mode?

Decision: Preserve read/evidence/history where safe; stop actions whose authority or correctness cannot be proven.

Commercial / product rationale: Governance systems must fail predictably rather than fabricate continuity.

Engineering rule: Each service defines DEGRADED behavior: e.g., stale integration → display last verified fact with timestamp but block high-impact action; model outage → deterministic workflow remains; evidence store outage → material approvals fail closed.

33. Critical Analysis of Current Product & Commercial Drift

Drift / risk	Why it matters	Severity	Refined resolution
Category breadth	ZoikoSuite spans compliance and business operations, creating risk of being described as ERP/HCM/accounting replacement without explicit system-of-record boundaries.	Critical	Lock “governed business operations intelligence platform” category; publish a system-of-record matrix and prohibit implicit replacement claims.
Pricing truth	Tiered pricing architecture exists, but final plan names/prices/limits are not established in this standard.	High	One approved commercial catalog; fail closed on missing mappings; no price/trial invention in code or copy.
Zoiko product adjacency	Payroll, HR, Billing and ZoikoLogia/Kriton can create ambiguity about what ZoikoSuite owns versus integrates.	Critical	Native integrations via explicit contracts; separate commercial entitlements and authoritative data ownership; no shared-table shortcuts.
Compliance language	A platform that maps obligations and controls can easily overstate “compliance” as guaranteed outcome.	Critical	Use scoped status semantics, source/effective-date versioning, limitations and claim registry; external assurance wording requires approval.
AI authority	Agentic automation can drift from recommendation to unsupervised consequential action.	Critical	Action-risk taxonomy, allowlist, deterministic preconditions, human approval, idempotency, postcondition verification and kill switches.
Dashboard confidence	Executive summaries can hide stale/missing evidence or conflicting sources.	High	Every metric/status carries freshness, source, scope, coverage and exceptions; drill-through is mandatory.
Regional intelligence	Global positioning can be mistaken for universal legal coverage.	High	Market release registry gates jurisdiction, source, language, data region, provider, integration and public claim.
Evidence quality	Uploading documents can be mistaken for proving control effectiveness.	High	Separate evidence submission/acceptance from test methodology, effectiveness result and attestation.
System authority	Connected-system replicas can become de facto truth through convenience.	Critical	Field-level source authority map, conflict state, freshness checks and controlled back-write paths.
Commercial vs tenant state	Past-due SaaS billing could be incorrectly linked to tenant operational/compliance data.	Critical	Commercial entitlement plane remains separate; restriction affects product access, not underlying business truth.
Zoiko One overlap	Bundle/direct paths can create double charging or entitlement conflict.	Critical	billing_source, transfer records, overlap detection and renewal reconciliation.
Provider coupling	AI, data or integration providers can become invisible policy authorities.	High	Provider registry, exact-use approval, abstraction, contract/security/privacy evidence, re-verification and offboarding.

Drift / risk	Why it matters	Severity	Refined resolution
Historical reproducibility	Updating rules, scores or source mappings can rewrite past reports.	Critical	Version all material source/rule/metric definitions; reports and decisions replay against historical versions.
Support privilege	Enterprise support may need deep visibility and become an ungoverned admin route.	High	Visible/time-bounded support access, no implicit approval/payment/policy authority, break-glass governance.
Launch visual completeness	A polished CFO/GC/CIO experience can appear ready before commercial, data, legal and operational controls are complete.	High	Section 27 signed acceptance is the go-live gate, not UI completion.

REFINED EXECUTIVE JUDGMENT

The decisive refinement is to separate five kinds of truth that can otherwise collapse into one dashboard: commercial entitlement, tenant operating facts, connected-system authority, governance/evidence state, and AI/automation output. Once these are separated — and linked by versioned source authority, market/release registries and immutable evidence — ZoikoSuite can scale across CFO, General Counsel and CIO use cases without becoming an uncontrolled ERP clone, an overclaiming “compliance guarantee,” or an autonomous model acting beyond organizational authority.

34. Authoritative Source Basis & Precedence

Source	Use in this standard
ZoikoSuite Landing Page Wireframe — approved canonical	Product category, compliance/business-operations positioning, modular platform structure, compliance engine, regional intelligence, AI automation, integrations, pricing architecture and market-facing trust posture.
ZoikoSuite persona pages v2.0 — /for-cfo, /for-gc, /for-cio	Primary executive buyer paths, risk framing, capability-to-outcome mapping, ERP/HCM displacement/coexistence narrative, assurance requirements and role-specific demo conversion.
Approved ZoikoSuite commercial separation framework	Standalone SaaS + optional Zoiko One; independent commercial model with shared technical platform services where approved.
Zoiko Billing / Payroll / HR standalone-product commercial doctrine	Cross-product commercial separation principles, billing_source discipline, shared-service boundaries and prevention of implicit bundling/double charging.
ZoikoLogia / Kriton controlled integration and governance estate	Source/evidence governance, privacy/security, audit replay, AI safety, provider governance and ZoikoSuite transfer constraints relevant to native intelligence integration.
Approved Zoiko Group software delivery standard	Understand before building; agree before integrating; test throughout; demonstrate outcomes; release only against documented evidence.
Current signed contracts/order forms and approved pricing catalog	Highest commercial authority for customer-specific price, entitlement, term, market and service commitment.
Applicable legal/regulatory, privacy, tax, employment, security and provider documentation	Market-specific implementation truth; must be revalidated at release and cannot be replaced by generic “global” assumptions.

Source-of-truth precedence: signed customer contract/order form and approved current commercial catalog → authoritative tenant/source-system facts and approved governance state → approved market/capability/provider/policy registries → current product documentation and communications → public marketing. Where sources conflict, charging and high-impact execution

fail closed, the discrepancy is recorded, and an accountable owner resolves it. Marketing never overrides contractual, legal, security or authoritative operational state.

35. Final CTO / Commercial Doctrine

ONE PLATFORM — FIVE PLANES OF TRUST — ZERO SILENT AUTHORITY

ZoikoSuite must make complex business operations governable, explainable and auditable without confusing visibility with authority. Every commercial entitlement has a source. Every operational fact has an owner. Every obligation has jurisdiction and time. Every control has a definition. Every evidence item has provenance. Every status has a rule. Every approval has an accountable actor. Every AI output has boundaries. Every autonomous action has explicit authority. Every public claim is tied to release truth. When price, market availability, source authority, evidence sufficiency, compliance status, provider eligibility or execution authority is uncertain, the platform must refuse to guess.

- Commercial truth is versioned and governed; code and telemetry do not invent charges.
- Tenant operating truth and ZoikoSuite subscription state are separate; access restriction never rewrites business facts.
- Connected systems remain authoritative for the domains they own; ZoikoSuite governs lineage, orchestration, evidence and decision context around them.
- Compliance is a scoped, evidence-backed operational state — never a universal guarantee produced by a green dashboard.
- AI accelerates work but does not become the legal, financial, employment, security or regulatory authority.
- Zoiko One is an integration and distribution advantage, not a prerequisite and not a duplicate billing path.
- Global design means verified market configuration, effective dates, residency and source authority — not universal launch claims.
- Assurance depends on evidence provenance, testing, exceptions, approval and replayability; documents alone do not prove effectiveness.
- Production readiness is demonstrated through data authority, reconciliation, negative testing, access control, AI evaluation, safe degraded states, recovery and signed acceptance — not visual completeness.

APPROVAL STATUS

This document is the recommended commercial, product and engineering baseline for ZoikoSuite commercial mode. It becomes the controlling production standard when Product, Commercial, Finance, Engineering, Security, Privacy, Legal/Compliance, Data Governance, AI/ML and QA formally approve the final price catalog, plan/entitlement registry, market and claim registries, system-of-record matrix, AI execution policy, integration certifications, security/privacy controls, numeric service objectives and Section 27 acceptance record.

Controlled Sign-Off Record

Function	Status	Approver / Date
Product / Commercial	Pending	
Engineering / Architecture	Pending	
Finance / Billing Operations	Pending	
Security	Pending	
Privacy / Data Governance	Pending	
Legal / Compliance	Pending	
AI/ML / AI Governance	Pending	
QA / Release Management	Pending
